

IN THE SPECIFICATION:

Please substitute the following paragraph for the paragraph starting at page 1, line 24 and ending at page 2, line 11.

Also, image observation systems using such HMD are known, in which a pair of image pickup systems and a pair of display systems are provided for left and right eyes of an observer, and an outside world image (outside world information) is converted by an image pickup device such as a CCD camera or the like into electric signals and then it is displayed on a display device such as a CRT or LCD. The outside world image can be observed three-dimensionally through a display optical system, utilizing binocular parallax. Hereinafter, this type of observation will be referred to as "video see-through observation". Thus, the outside world can be observed as if by naked eyes.
